

ECASm level switch is a capacitive level sensor for level measurement of conductive liquid, low conductive liquid, granulated materials with solid particles, adhesive and acidic/basic liquids.

When product comes over the sensor, a capacitance change occurs and when this change exceed adjustment threshold, contact output is delivered. Designed for difficult process conditions.

Refrigerated models can be manufactured for high temperature and pressure conditions.

Calibrations of triggering point and relay operation range can be performed by the user under workplace conditions. It can be connected horizontally or vertically.

### Application Areas

Liquid tanks, food machines, cooling liquid tanks, shipping, glycol tanks, brine, waste water tanks.

Oil tanks, CO2 liquid tanks, high temperature tanks, non-conductive liquids.

Grain stores, cement, sand feed, flour, milk powder, organic and plastic granule.

Sticky hot and high viscosity liquid, acid and chemical liquids.

# ECASm

## CAPACITIVE LEVEL SWITCH

**ECASm 101**  
**ECASm 203**  
**ECASm 305**  
**ECASm 408B , ECASm 408T , ECASm 408Tm**

### Avantajları :

- \* Optionally high temperature-resistant design
- \* Easy assembly and sensitivity adjustment.
- \* Not affected by foam, liquid splash and probe coating.

### Technical Specifications:

|                           |                                                                                                                               |

| Max. Tensile Force        | Max. 40 Nm                                                                                                                    |

## Working Principle :

Capacitance definition, assuming two parallel conductive plates are used;

$$C = \frac{\epsilon_0 \cdot \epsilon_r \cdot S}{d}$$

C: Capacity , Farad  
S: Surface Area , m<sup>2</sup>  
d: Distance , m

However, there are scarcely any sensor type which this definition can be practically utilized. Above Formula can no longer be reliable especially when residual areas increase due to large distance (d) (which is usually the case). Thus, measuring impedance for distance measurements give more accurate results than capacitance measurement.

Excitation applied between 10 KHz...250 KHz based on length for all our models. ( $\omega = 2\pi \times f$ ) Linearity error that may be caused by conductivity component (R) effect is prevented by electronic circuit design and mechanical design. Reduced to a level lower than 1ppm, acceptable as zero.

## Electronic Unit with Cable:

Electronic unit and sensor component can be separated by a cable protected against exterior conditions for easy calibration on site. Cable provides easy assembly for user by its property not affecting capacitive measurement.

## Sample Model:

## Parts:

## Housing :

| ORDER CODE | TYPE  | MATERIAL | PROTECTION CLASS | TEMPERATURE (°C) | SIZE a x b (mm) |
|------------|-------|----------|------------------|------------------|-----------------|
| 192        | B036p | Plastic  | IP 65            | (-) 30...(+) 100 | Ø 93 x 35       |
| 193        | B037p | Plastic  | IP 65            | (-) 30...(+) 100 | Ø 93 x 43       |

## Cooling :

## Infication and Calibration :

- **RlyLED ( Red ):** Means “Relay Active” during normal operation; means operation continues during calibration. Light is continuous during normal operation mode – if relay is active – and flashes during calibration mode. It is red colored
- **PwrLED ( Green ):** Means there is no sensor failure during normal operation, and means “desired measurement values are saved in memory” during calibration. Operates by flashing. If light is continuous, it indicates failure. Green colored.
- **CAL - S Button:** Used to acquire “High Level-span-“value during calibration
- **SET - TRG Pot:** Used to acquire “Low Level-zero-“value during calibration
- **SET - DIF Pot:** Adjusts relay triggering point between Zero-Span values.
- **CAL - Z Button:** Adjusts “Release” level of the relay activated by “TRG Pot”. Highest adjustable value is equal to half (50%) of the operation region specified by “Z and S”. Meaning that, when DIF Pot is at 100% and relay is pulled, the level to release it shall be reduced as half of the total scale
